transcript of a handwritten note

european female body – EFB – lying on her stomach in a white studio on the floor

short breath

edding CONTROL 78 black ink, white paper

production of surplus bodily warmth

iPhone

wikipedia

disappointment due to fresh information on the limits of brain control after speculating on the possibility of influencing the sensation of overheating the body after excessive dance practice:
thermoregulation in both ectotherms and endotherms is controlled mainly by the preoptic area of the anterior hypothalamus. Such homeostatic control is separate from the sensation of temperature.

slow breath and deep breath

lactic acid concentration

hypoglycemia

neurotransmitters

hypothalamus

memory of the perspective of seeing a close friend for lunch this week
